

The report of Daam Kesht reporter from Chabahar

Water: Rich Jewel of Sistan-Baluchestan

Sistan-Baluchestan, a province of 187502 Square kilometers is located at the south east part of the country and is one of the less populated provinces despite the large vast of it. It is one of the desert provinces of Iran and has problems like hot weather, little rain, under earth resources, poor plant cover and soil erosion. These issues have made less educated people, high level of population, facing more immigrants and less employment in this province. Deserts are

naturally faced with many different limitations but possess high potential of water and soil management to maintain the food and living resources of native people. The worrisome point of this field is land destruction, called desert-making, made by human unsuitable activities. The clear outcome of this phenomenon if continent changes like running sands to agricultural, living and industrial lands and traveling roads. So the one million of 2 million hectares of deserts is faced with wind erosion and is in a critical situation. Now there is a number of 5/4 million hectares of deserts and one million hectares of sandy lands seen in this province.

The Implication of water solutions is to halter the severe overflows and hard erosion of soil in this province, which is usually Marl liked. It is also be useful at reviving the flowing waters and their use for agriculture. You can read the whole story in this issue.

The Strategy of Unification at Food Industry

Free economy has been one of the main debates of economy's experts and managers for the last years.

Iran has many different capabilities but the government intervenes in legislation and investment activities and it leads to ignore the private section activities at the economy of macro or micro levels.

In order to obey the Leader's concern about considering the Code 44, everybody is trying to omit the obstacles.

At the Agricultural section we have many investments risk. So the Agricultural Commission

and converting industries are managing to have a meeting on debating about 7 power stations which are ready to launch.

Ahmadijad believes that privatization is not allocation all resources to some known people. It should be allocated to people and the economical growth will be happen when the investors reach the security of their asset.

But it hasn't yet happened and it is seriously recommended that the government can give the responsibility to the private section to make Code 44 happen.

Agricultural Budget: Insufficient for Development

The budget of 1386 had many strong points and caused the excitements of many representatives of parliament. But if we look closer we will find that besides the delay of presenting the budget, couldn't gain the satisfaction

of representative in the field of credit allocation. It showed that even the increase of credits can't lead to self-efficiency in this field at 1386. Economical experts especially the agricultural ones believe that it's necessary to have a budget of about 2000 billion dollars at 1386. Moreover, the rate of research growth of about 13/5 appointed at 4th development plan and compensation of underdevelopments, need 11000 billion dollars of banks credits in agricultural section. Every other strategy is useless in this filed and leads to defeat.

The Bright Way to Oil Seeds' Self-Efficiency

Dependence on edible oil is definitely one of the main national concerns in Iran and the excitement of having a self-efficient industry in this field will not be at the extreme if we can't produce the needed oil ourselves. This process will be urgent when foreign exporters come up with the temptation of rumors on a possible boycott in order to increase the prices and threat the country. These are the very reasons of oil-efficiency importance reported by the experts and believers to the country. Where the self-efficiency of other products is a kind of relative advantage, oil self-efficiency is an urgent. Alireza Mohajer, the executive manager of oil seeds' self-efficiency plan, is governing the team of efficiency which is going to be capable in producing 70 percent of oil, till the next 3 years. The body of the team is composed of many famous and capable experts and mangers, oil extracting industries and farmers who produce many different oil seeds and even importers. After about 2 years, we are once again facing with Mr. Mohajer and now is seems more possible for the self-efficiency plan to be directed to the main purpose of oil seeds. Mr. Mohajer and his team were responsible of doing something impossible and change the usual process of oil import.

Agricultural Bank: More Firm and Successful

Agricultural Bank is initiated to maintain the financial resources of farmers. But the traditional and shaking structure of agriculture in the society, gained by the previous achievements, has made it face with many severe problems. Agricultural field was too successful during the management of Rasoolof yet was dreaming for an independent and unique bank which is profitable and economical.

The 9th government belief to support farmers, it was evitable for the bank to change the way and allocate all profits to this section.

Noorbakhsh ignored all unproved critiques and just continue to reach the aim of the bank and could gain the title of "the super bank of Iran" for the 4th times. He made a good reputation and was named as the only banker of the country who could achieve the predetermined goals of some deprived clients, besides all kinds of risks.

A growth of 38 percent of asset at 1384 and overtaking other banks in this field, and increasing the rate of accounts show the strong status of Agricultural Bank and the possibility of more reliable dependence of Agricultural section to its unique bank.
